

Aarogya Sathi Report

Generated on September 27, 2025 at 12:37 PM

Patient Information

Patient Name:	Aman Shaikh
Analysis Type:	Image Analysis
Analysis Date:	September 27, 2025 at 07:07 AM
Report Generated:	September 27, 2025 at 12:37 PM

Reported Symptoms

it doesn't feel itching just appearing on areas where sweating is most

Analyzed Image

Visual Observations

- Multiple light brown to tan patches on the skin
- Patches are irregularly shaped and vary in size
- No significant scaling, crusting, or inflammation observed
- Lesions appear to be in a similar stage of development

Possible Conditions

Rank	Condition	Probability	Description
------	-----------	-------------	-------------

1	Pityriasis versicolor	80%	The appearance of multiple light brown to tan patches, particularly in areas where sweating is common, is consistent with pityriasis versicolor, a superficial fungal infection of the skin.
2	Post-inflammatory hyperpigmentation	20%	The patches could also represent post-inflammatory hyperpigmentation, but the lack of significant inflammation or history of trauma makes this less likely.

Recommended Next Steps

- 1. Schedule a dermatology appointment for further evaluation
- 2. Avoid excessive sweating and tight clothing
- 3. Monitor for changes in the skin lesions
